

MAIN

BRIEF DESCRIPTION:

The Main window is the entry spot into measurement, analysis and reporting software. From main window all other units are accessible:

- projects, visits and subjects management unit
- test modules
- filter and compare unit
- reporting unit
- backup unit
- settings unit

In general Main window is divided into four panels:

- In Select panel project and visit or subject can be selected, that are used to define the set of subjects or projects and visits for which tests can be performed. In Units panel all other non-test units are accessible.
- In the central portion of the window is a table that contains subjects or projects and visits (depending on the selection in the Select panel) for which tests can be performed. If a project and a visit are selected then the table contains a set of subjects in the selected visit, while if a subject is selected then it contains a list of projects and visits for the selected subject.
- On the right side of the window is a set of available test modules. Click on a button opens a test module. If at least one measurement of a certain test was performed and saved for the selected project, visit and subject, graphical indicator in the right bottom corner of the test button is visible (graphical indicator is updated when project, visit or subject are changed).

- In the top left corner of the window is the help button that opens help for the Main unit.
